

## FAN USE

Fully controlled, low-pressure RQ Radial Fans intended for square ducts can be universally used for complex air-conditioning, from simple venting installations to sophisticated air-handling systems. Ideally, they can be used along with other components of the Vento modular system, which ensures inter-compatibility and balanced parameters.

## OPERATING CONDITIONS, POSITION

These fans are designed for indoor and outdoor applications, and to transport air without solid, fibrous, sticky, aggressive, respectively explosive impurities. The transported air must be free of corrosive chemicals and chemicals aggressive to zinc and/or aluminium.

The acceptable temperature of transported air can range from -30 °C to +40 °C, and with certain types up to +70 °C. The maximum nominal values for each fan are included in table # 3. RQ fans can work in any position.

## DIMENSIONAL RANGE

RQ fans are manufactured in a range of seven sizes according to the A x B dimensions of the connecting outlet flange. Several fans differing mainly in the number of poles the motor uses are available for each size. When planning the fan for the required air flow and pressure, the following general rule is applied; fan motors with a higher number of poles reach the required parameters at lower RPM, which results in lower noise and longer service life. Fans with a higher number of poles also have lower air velocity in the cross section, which results in lower pressure losses in the duct and accessories, however, at higher investment costs. The standard dimensional and performance range of single-phase and three-phase RQ fans enables designers to optimize all parameters for air flow up to 7.800 m<sup>3</sup> per hour.

## MATERIALS

The external casing of RQ fans is made of galvanized steel sheets (Zn 275 g/m<sup>2</sup>). Impeller blades – with forward curved blades are made of galvanized sheet steel, with aluminium diffusers. Motors are made of aluminium alloys, copper and plastics. The motor's high quality enclosed ball bearings with permanent lubricating filling enable the fans to reach a service life above 40,000 operating hours without maintenance.

## MOTORS

Compact single-phase and three-phase asynchronous motors with an external rotor and a resistance armature are used as drives. The motors are situated inside the impeller, and during operation are optimally cooled by the flowing air. The motors feature low build-up current. Impellers along with the motor are perfectly statically and dynamically balanced. The motor electric protection degree is IP 54 for all RQ fans except of RQ 20 and RQ 25 fans (IP 44).

## ELECTRICAL EQUIPMENT

The wiring is terminated in a terminal box of IP 54 protection degree. Single-phase motors are equipped with a starting capacitor which is mounted on the fan casing. For wiring diagrams, refer to a separate section.

## MOTOR PROTECTION

As standard, permanent monitoring of the internal motor temperature is used in all motors. The limit temperature is monitored by thermal contacts (TK-thermo-contacts) situated in the motor winding. The thermo-contacts are miniature thermal tripping elements which after being connected to the protective contactor circuit protect the motor against overheating (damaging) due to phase failure, forced motor braking, current protection circuit breakdown or excessive temperature of the transported air. Thermal protection by means of thermo-contacts is comprehensive and reliable providing they are correctly connected. This type of protection is essential especially for speed controlled and frequently started motors and motors highly thermally loaded by hot transported air.

**Therefore, the fan motors cannot be protected by conventional thermal protection ensured by the motor overcurrent protective elements!**

Maximum permanent thermo-contact loading is 1.2 A at 250V / 50V (cos φ 0.6), (respectively 2 A at cos φ 1.0).

## FAN OUTPUT CONTROL

Generally, several types of control can be used with fans. However, voltage control is the most suitable for RQ fans. RQ fans can be steplessly controlled providing the change in voltage is stepless.<sup>13</sup> In practice, stage voltage controllers are most often used.

TABLE 1  
THE INPUT VOLTAGE AND CONTROLLER'S STAGE

MOTOR TYPE	CURVE CHARACTERISTICS - CONTROLLER'S STAGE				
	5	4	3	2	1
1 - phase	230 V	180 V	160 V	130 V	105 V
3 - phase	400 V	280 V	230 V	180 V	140 V

TRN stage voltage controllers can control the fan output in five stages in 20 % steps, with which five pressure-airflow relation curves in the working characteristic of each fan comport.

Refer to table # 1<sup>2)</sup> showing the correlation between the input voltage and selected stage of the controller for single-phase and three-phase motors. RQ fan motors can be operated within a range of approx. from 25 % to 110 % of the rated voltage.

The recommended product line includes single-phase and three-phase TRN controllers (simplified TRRE and TRRD controllers can also be used to control RQ fans; however, they do not provide a protection function.

### MEASURING THE PARAMETERS

The output characteristics of RQ fans are measured in REMAK testing laboratory for aerodynamic and electrical measurements of fans and pressure losses of passive elements. This testing laboratory is equipped with a LabView® computer system from National Instruments® for the automatic collection and evaluation of all measured data. This testing laboratory complies with EN 24 163 and AMCA STANDARD 210-74 Standards. Noise parameters of RQ fans are measured in REMAK's acoustic testing laboratory in accordance with the ČSN EN ISO 3743-2 Standard, which establishes the technical method of the sound power level determination in a special reverberant chamber. A measuring line of aerodynamic parameters is used to set the fan to the required working point when measuring the noise.

<sup>1)</sup> Refer to chapter „Stepless Electronic Control“ of RP fans .

<sup>2)</sup> For detailed information, refer to the chapter "Fan Output controllers".

<sup>3)</sup> For a recap of technical acoustic terms, an explanation of the measuring methodology and an outline of noise attenuation, refer to the catalogue sections "Duct Radial Fans" or "RF Roof Fans".

### Operating Characteristics

Output characteristics in the "Data Section" determine the relationship curve of the air flow rate  $V$  ( $m^3/h$ ) and total fan pressure  $\Delta p_t = \Delta p_s + p_d$  (Pa).

For an explanation of the correlations and relations of important data, refer to the section "RP Fans".

### Noise Parameters

In the "Data Section" of this catalogue you will find noise parameters radiated to the outlet, surroundings and inlet. The total sound power level  $L_{WA}$  [dB (A)], i.e. the total level of the radiated A-scale sound power, is always given. Further, the octave value  $L_{WA,oct}$  of the A-scale sound power level for octave bands from 125 Hz to 8 kHz is also given.<sup>3)</sup>

### ACCESSORIES

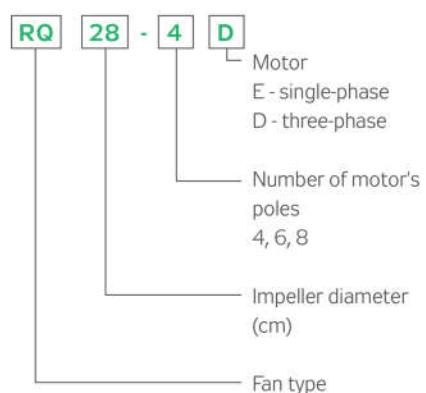

RQ fans belong in the wide range of Vento modular venting and air-handling system components. Any air-handling set-up, from simple venting to sophisticated comfortable air-conditioning, can be created by selecting suitable elements. The following accessories can be ordered along with RQ fans:

- Elastic connections DV, DK, counter-flanges
- TRN Controllers and ORe 5 controllers
- TRRE, TRRD Controllers
- STE, STD Protecting Relays

### FAN DESCRIPTION AND DESIGNATION

The key for type designation of RP fans in projects and orders is defined in figure # 1). For example, type designation RQ 28-4D specifies the type of fan, impeller and motor.

FIGURE 1 – TYPE DESIGNATION OF RQ FANS

## DIMENSIONS, WEIGHTS AND PERFORMANCE

For important dimensions of RQ fans, refer to Figure #2 and Table #3. For basic parameters refer to table #3.

All further important data are included along with each fan's characteristics in the "Data Section" of the catalogue.

## SYMBOLS USED IN TABLE 3:

$V_{max}$	maximum air flow rate
$n$	fan speed measured at the highest efficiency working point (5b), rounded to tens
$U$	nominal power supply voltage of the motor without control (all values in the table are to this voltage)
$P_{max}$	electric motor maximal power output
$I_{max}$	maximum phase current at voltage $U$ (this value must be checked)
$t_{max}$	maximum permissible transported air temperature at air flow $V_{max}$
$C$	capacitor capacity with single-phase fans
FM.	frequency inverter
$m$	weight of the fan ( $\pm 10\%$ )

ErP2015 Fan compliance with the requirements of Regulation 2009/125/EC (NOT compliant fans must not be used within EU region)

## DATA SECTION

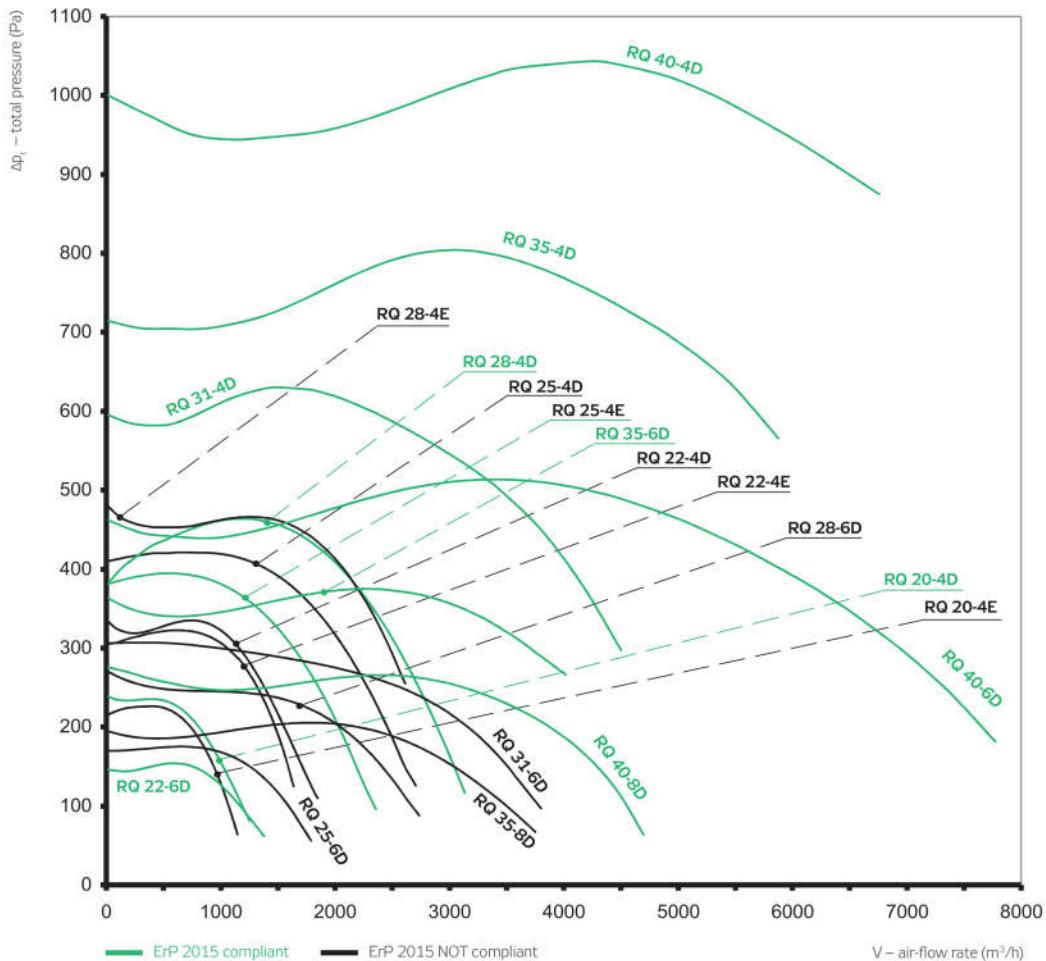

In the data section of the catalog, in addition to the characteristics of each fan, there is a table of the most important values. The importance of individual lines is explained in Table 4. These values are also listed on the nameplate of each fan. Graph 1 enables quick selection of a suitable fan and alternate comparison of RQ fans. Only the highest characteristics of each fan at nominal supply voltage, i.e. without a controller or with a controller set to five stage, are included in this graph.

TABLE 4 – FAN PARAMETERS

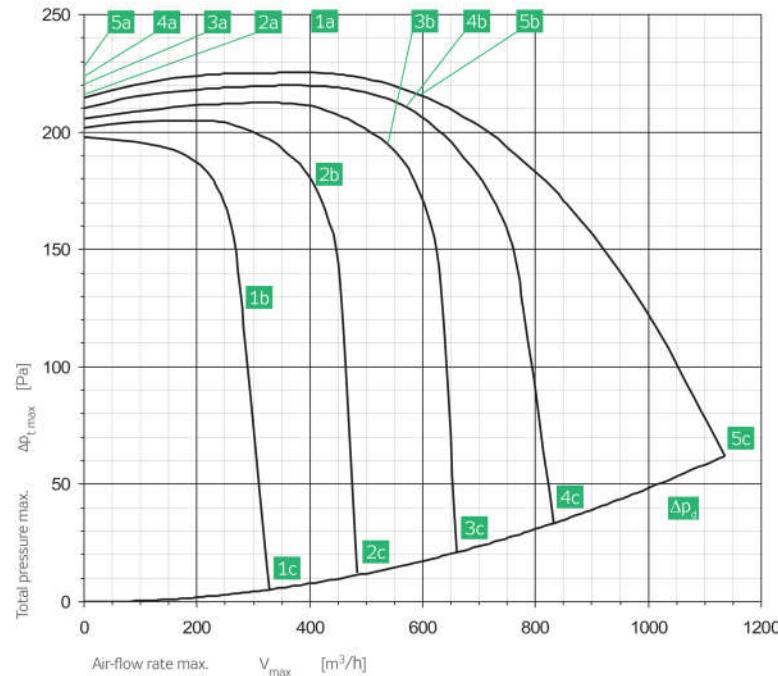

RQ 20-4E		
Power supply	230 V	50 Hz
Max. electric input	P <sub>max</sub> [W]	303
Max. current (5c)	I <sub>max</sub> [A]	1.47
Mean speed	n [min <sup>-1</sup> ]	1400
Capacitor	C [ $\mu$ F]	5
Max. working temp.	t <sub>max</sub> [°C]	40
Max. air-flow rate	V <sub>max</sub> [m <sup>3</sup> /h]	1135
Max. total pressure	ΔP <sub>t max</sub> [Pa]	225
Min. static pressure (5c)	ΔP <sub>s min</sub> [Pa]	0
Weight	m [kg]	9
Five-stage controller	type	TRN 2E
Protecting relay	type	STE

The meaning of individual lines is as follows:

- 1 Value of nominal power supply voltage
- 2 Maximum power input of the motor at working point 5c.
- 3 Maximum current at nominal voltage at working point 5c.
- 4 Mean speed, rounded to tens, measured at working point 5b.
- 5 Capacitor capacity with single-phase fans.
- 6 Maximum permissible transported air temperature.
- 7 Maximum air flow at working point 5c.
- 8 Maximum total pressure between points 5a–5c
- 9 Minimum permissible static pressure at point 5c.
- 10 Total weight of the fan.
- 11 Recommended fan output controller.
- 12 Recommended protecting relay of the fan without controller and control unit.

## INSTALLATION

- RQ fans (including other Vento elements and equipment) are not intended, due to their concept, for direct sale to end customers. Each installation must be performed in accordance with a professional project created by a qualified air-handling designer who is responsible for the proper selection of fan. The installation and commissioning may be performed only by an authorized company licensed in accordance with generally valid regulations.
- It is recommended to use elastic connections; a DV elastic connection on the discharge side and the DK elastic connection on the intake side.
- It is advisable to always place an air filter in front of the fan to protect it and the duct against dirtying and dust fouling.
- The RQ fans are provided on three sides with anchoring holes to be anchored to the foundations in one of three possible positions ① ② ③ (see fig. #3).

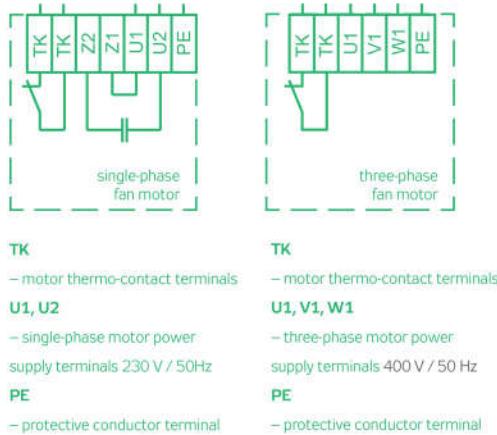

FIGURE 3 – ANCHORING HOLES

## WIRING

- The wiring can be performed only by a qualified worker licensed in accordance with national regulations.
- An all-plastic terminal box fixed with screws to the fan casing, and equipped with WAGO terminals; max. cross-section of connecting conductors  $1.5 \text{ mm}^2$
- The fans are equipped with thermo-contacts situated in the motor winding; they are connected to the TK terminals. If the motor gets too hot, the thermo-contact will open. The thermo-contact must be connected to the control or regulating system (e.g. control unit, TRN controller or STE relay) which is able to evaluate the failure, and protect the motor against unwanted thermal effects.

FIGURE 4 – WIRING DIAGRAM

The wiring diagrams with front-end elements (protective relays, controllers, control units) are included in the installation manual, respectively in the AeroCAD project.

On the following pages you will find some basic examples of the fan connection to output controllers and control units. AeroCAD software is available for precise design of the wiring.

## EXAMPLES, RQ FANS

**EXAMPLE A****RQ FANS WITHOUT OUTPUT CONTROL  
AND WITH STE PROTECTING RELAY**

The RQ fan connection in a simple venting system without output control is shown in figure # 5.

This connection ensures:

- Thermal protection of the fan using thermo-contacts and protecting relay, STE (single-phase) or STD (three-phase).
- Manual switching on/off of the fan using buttons on the STE(D) protecting relay.

After pressing the button marked "I" on the STE(D) protecting relay, the fan starts and the button will stay in the depressed position, signalling the fan's operation. The fan can be stopped by pressing the button marked "O".

If the motor winding is overheated above +130 °C due to overloading, the thermo-contacts in the motor winding will open.

Upon the thermo-contacts opening, which are interconnected with the fan terminal box, the STE(D) protecting relay circuit TK, TK will be disconnected. As a reaction to this state, the STE(D) protecting relay will disconnect the power supply to the overheated motor. After cooling down, the motor is not automatically started. The failure must be confirmed (unblocked) by the operator by pressing the black "I" button..

**EXAMPLE B****RQ FANS WITH OUTPUT CONTROL  
AND TRN CONTROL**

The RQ fan connection in a simple venting system with one or more fans which must be controlled independently using the TRN controller with ORe 5 controller is shown in figure # 6.

This connection of the speed controller ensures:

- The possibility of fan output selection within the stage range 1-5.
- Thermal protection of the fan
- Fan switching on/off manually by the ORe 5 remote controller.
- Fan switching on/off manually by any other switch (like room thermostat, gas detector, pressostat, hygrostat, etc.) on terminals PT1, PT2.

Upon selecting the required output stage using a selector on the ORe 5 controller, the fan will start at the corresponding speed. The closed switch connected to PT1, PT2 terminals and the thermo-contact circuit connected to TK, TK terminals are essential for the fan operation. The switch connected to PT1, PT2 terminals can externally stop the fan. If this possibility is not used, it will be necessary to interconnect terminals PT1 and PT2. If the fan is overloaded, the thermo-contact circuit will be disconnected due to overheating of the motor winding. As a reaction to this state, the controller will disconnect the fan power supply, and the red control light on the ORe5 controller will signal the failure. After cooling down, the motor is not automatically started. To restart the fan, it is necessary first to set the selector to the "STOP" position, and thus confirm failure removal, and then to set the required fan output. In this arrangement, the option "STOP" must not be blocked.

FIGURE 5 – FAN CONNECTION

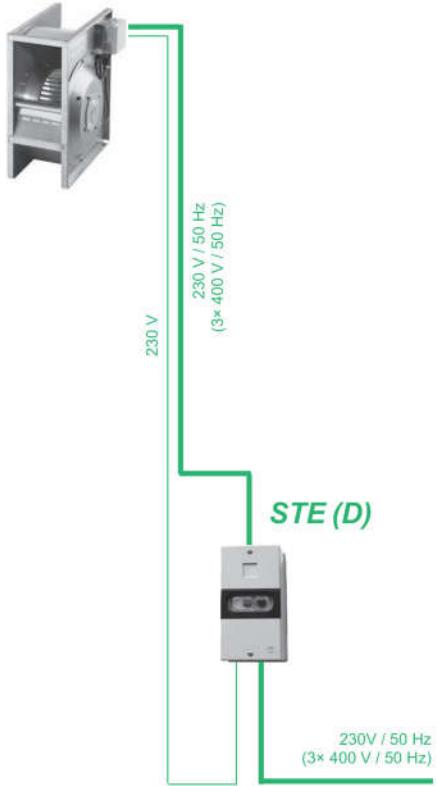

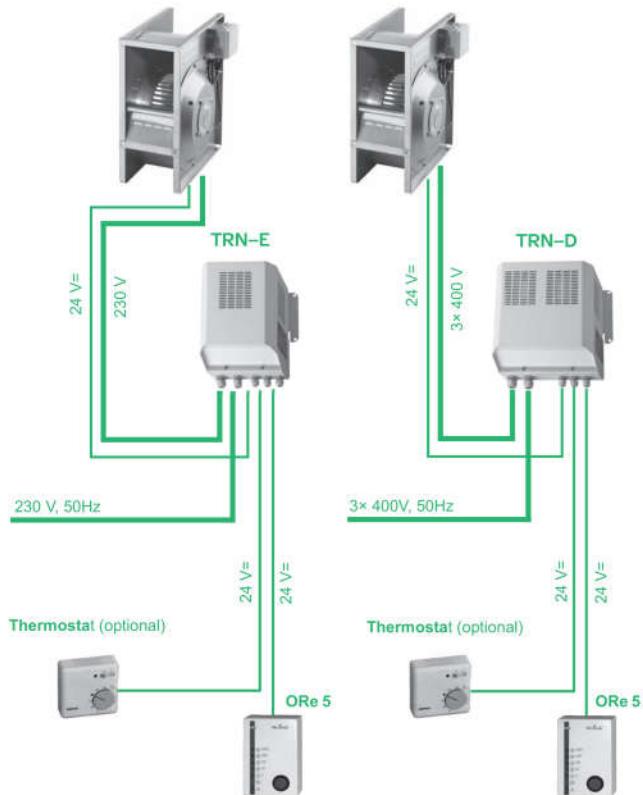

FIGURE 6 – FAN CONNECTION

**EXAMPLE C****RQ FANS WITHOUT OUTPUT CONTROL  
AND WITH CONTROL UNIT**

The RQ fan without output control connection in more sophisticated venting systems using the control unit is shown in figure # 7.

Among others, this connection ensures:

- The motor protection (TK thermo-contact terminals are connected to 5a, 5a, 5b, 5b terminals in the control unit).
- Manual or programmable switching on/off of the entire device using a control unit.

**The air-handling system is started by the control unit. All protecting and safety functions of fans as well as the entire system are ensured by the control unit.**

**EXAMPLE D****RQ FANS WITH TRN CONTROLLERS  
AND CONTROL UNIT**

Connection of RQ fans equipped with an output control with two TRN controllers and an independent internal control for each controller is shown in figure # 8. The internal control is installed in the control unit during production. Among others, this connection ensures:

- Manual selection of the fan output within the stage range 1-5 via HMI controller and/or using time schedule function of control unit, separate or independently for the inlet and outlet (this can be used to get the required overpressure or underpressure in the room).
- Thermal protection of the motor (connecting the TK, TK thermo-contact terminals to 5a, 5a, 5b, 5b terminals in the control unit).
- Manual or programmable switching on/off of the entire device using a control unit.

In this connection, all additional functions of the controller must always be blocked by interconnecting the PT2 and E48 terminals in the TRN controller.

**The air-handling system is started by the control unit. Other properties are influenced by the setting options of connected components (controllers, controls). All protecting and safety functions of fans as well as the entire system are ensured by the control unit.**
