

Heat Resistant In-line Axial Fans

VO & VOK series

The VO series in-line axial fans have an equally sectioned cylinder shape, which makes it suitable to be fitted in air ducts or vent openings, while the VOK series have a rim on the outer side of the cylinder making it ideal for connecting air ducts.

The VO and VOK Series high temperature fans are designed to resist temperature of up to 150°C. They can be fitted in hot air distribution ductwork system connected to fireplaces and other heating installations.

As an additional feature the fan can be equipped with a thermostat which automatically turns on the unit when the temperature reaches 50°C and turns it off when it drops to 35°C.

The body, the turbine, and the back shutter of the VO and VOK series heat resistant fans are manufactured from aluminum alloy providing efficient cooling and fire safety, while the noiseless and highly efficient electric motors are sealed for life and totally maintenance free.

The fan is equipped with a special shutter which protects it from overheating in case of a sudden power cut. The embedded heat resistant Long Life double capsulated ball bearings guarantee smooth operation for over 30 000 hours of continuous usage.

As an additional accessories we offer decorative grilles made from Glass-Filled Polyamide able to resist temperatures of 200°C.
